MASTER GAIN

GENERAL DESCRIPTION

The TDA4306 is an integrated circuit which controls the amplification of the four output signals (White, Yellow, Green and Cyan) from the frame transfer sensors (NXA1021 to NXA1041). The matching of the four channels is excellent over the whole control and temperature range. An on-chip white clipping circuit protects the white processor (TDA4303) from output signals that are too large. If white clipping occurs, a pulse is available to kill the colour information. Highlights will always be white, not coloured.

Features

- Four variable gain amplifiers
- White clipping circuit
- Blanking switch
- 2.1 V reference voltage

Notes to the characteristics

1. The maximum input voltage is permitted only if the input voltage minus the DC offset voltage = 2.1 V. If the input voltage minus the DC offset voltage = 1.6 V, the maximum input voltage is 1 V(p-p).
2. Over the range 2 to x 8, after that each channel is adjusted to 0.
   This is possible only if the blanking pulse is switched off and the DC input voltage is equal to V_{ref}.
